**Subject:** Comments on Proposed Rulemaking - Final Draft Delta Plan

Dear Ms. Messer

Being a fisherman we have had mismanagement problems in the past resulting in not enough water and thus not enough oxygen for a viable fish stock, resulting in major kill off of juvenile Salmon and the river smelt that they feed on. Most of the fish that died were Coho Salmon and Steelhead plus other fish as well. Here's a URL that explained about the Klamath fish die off in

2002: [http://www.fws.gov/arcata/fisheries/reports/technical/Klamath\\_River\\_Dieoff\\_Mortality\\_Report\\_AFWO\\_01\\_03.pdf](http://www.fws.gov/arcata/fisheries/reports/technical/Klamath_River_Dieoff_Mortality_Report_AFWO_01_03.pdf)

There was another kill off of Salmon in the American river due to an insufficient water supply in 2006 that resulted in insufficient oxygen supply that killed off

I understand that the State Water Resources Control Board is supposed to provide you with information about how much water must stay in the Delta and how much can be exported. Is it true that you have completed the Delta Plan before you even have that information? How can you say what is needed for the Delta when you don't have the most basic scientific information?

Do you think your plan will leave enough water for a habitat that will harbor healthy fish, birds and wildlife? If you have made a mistake will you stand up later and admit that the mistake was yours?

Regards, Kent Snyder
